▶ 无油涡旋式压缩机原理

Working Principle

汉钟涡旋压缩机采用专用型线的动静涡盘相互齿合而成完成吸气、压缩和排气的工作过程。其中静盘固定在机架上不动，动盘由偏心轴驱动并由防自转机构制约围绕静盘基圆中心作很小半径的平年转动。气体由静涡卷盘的外围通过滤清器自由吸入、随着偏心轴旋转，气体在动静涡卷盘齿合所组成的若干对月牙形压缩室被逐渐压缩，然后由静涡卷盘中心部位连续排出。

The scroll air end by orbiting scroll and fixed scroll inter winding each other completes the process of suction, compression and discharge. The fixed scroll is fixed on the frame, while the orbiting scroll is driven by the eccentric shaft and restricted by the anti-rotation mechanism to make a small radius movement around the center of the fixed scroll. The gas is freely sucked in through the periphery of the scroll reel through the filter. As the eccentric shaft rotates, the gas is gradually compressed in the crescent-shaped compression chamber being composed of the fixed and orbiting scrolls and then discharged by the central part of the fixed scroll.
